Class field notes / p. 10

Warlock / p. 16

The Guild we build together

History, people, and a living experiment in working together

A cooperative beginning

RaidGuild took shape in 2019 from Odyssy, a three-person agency with Ven, Dekan, and Sam already experimenting with cooperative work. They pooled income in a multisig and used light governance to decide what to fund. The question was larger than one agency: could builders own and govern a network for their work together?

MetaCartel offered a place to try those ideas. James Young and Peter Pan helped draw Odyssy into that early community. James Waugh and Cooper Turley were part of the wider MetaCartel circle connecting people, ideas, and experiments. Building in that company led to Pokemol and then DAOhaus: tools for making DAOs easier to launch and use.

The first party grows

A DAOhaus prototype received a $1,500 community award at a Berlin hackathon. RaidGuild's treasury also drew on leftover PokeMol grant funds and ETHBerlin funds. The group put shared resources toward coordination tools and a wider builder network.

An early public introduction at ETHDenver brought prospective collaborators and clients. Early RaidGuild members included Cooper Turley, Elliott Conway, Yalor (yalormewn), Hammad Jutt (meta_dreamer), peth, and Scottrepreneur.

Different hands on the wheel

Cohorts helped newcomers find their party, and elected stewards took care of shared operations. Successive brand stewards—Ven, TW, Suede, and Louchi—gave the Guild different looks and stories. Each era brought new energy while the builder-owned, community-first idea remained central.

The Field Guide turns that living history into places and characters. Queen Raida scouts and scribes; people make the judgments and build trust. Moloch gives a face to coordination failure. The Guild keeps changing because its members keep making things together.

The shared treasury was only one part of the experiment. A builder-owned network also needs people to bring in work, assemble teams, care for tools, keep records, and make room for newcomers. Cohorts and stewardship grew around those needs. Membership meant taking part in shaping the organization as well as benefiting from it.

The Guild also developed a Marshall Islands DAO LLC to connect onchain governance with the practical world of client relationships, contracts, liability, and taxes. The aim was to give collective work a structure that could meet people and institutions where they already operate.

The work continues to change. A network first known for Web3 services and DAO coordination tools now includes applied AI, games, and experiments that cross into physical making. New members bring new obsessions and form new parties. The through-line is ownership: builders helping decide how their network works and sharing in what they create.

THREAD OF THE STORY

2019 A cooperative agency and MetaCartel work frame the Guild idea.

Early tools Pokemol leads toward the DAOhaus prototype and Berlin award.

Opening out RaidGuild begins with the award; ETHDenver brings a public introduction.

Growing practice Cohorts and stewardship develop as the builder network evolves.

Beyond the first raids AI, games, and community offshoots open new paths for the builder network.

What is RaidGuild · handbook ↗ · Meet Odyssy, the DAO Launchers · Cooper Turley, 11 Dec 2019 ↗ · Cooper Turley · Meet James Waugh (2019) ↗ · RaidGuild Portal · member profiles ↗

Is this your kind of party?

Builders. Explorers. Nerds. Bring something strange.

RaidGuild is for people who see something worth making and start figuring out how. Bring curiosity, initiative, and the willingness to bring other people into the work.

You'll probably feel at home if you...

- Make things because you can't leave an interesting idea alone.
- Find collaborators, ask useful questions, and follow through.
- Share what you learn and help the next person get further.
- Enjoy weird worlds, deep rabbit holes, and people with unusual obsessions.
- Can challenge an idea, hear a challenge back, and keep building together.

You may find it frustrating if...

- You want someone to assign your next task and manage every step.
- You expect joining a community to produce a steady queue of paid work.
- You need everything settled, polished, and predictable before participating.
- You're mainly here to extract contacts, attention, or opportunities.

High agency is a party skill.

Take initiative. Make your intentions visible. Ask for help when you need it. Respect other people's time and boundaries. Finish things—or tell your party what changed.

TW · What the Fuck is Raid Guild ↗ · What is RaidGuild · handbook ↗

Party agreements

Carry your share

Make a clear commitment and follow through. If scope, time, or capacity changes, say so while the party can adjust. Ask for help before you are stranded. Leave notes and a handoff someone can use.

Challenge ideas. Respect people.

Disagree with substance. Ask what you might be missing and make room for quieter voices. Be direct without humiliation. A joke does not erase a boundary: respect consent, privacy, and a clear no.

Share credit and context

Credit collaborators. Set expectations about ownership, payment, and time before work gets tangled. Document useful discoveries. An introduction is not a claim on someone's labor.

Make repairs

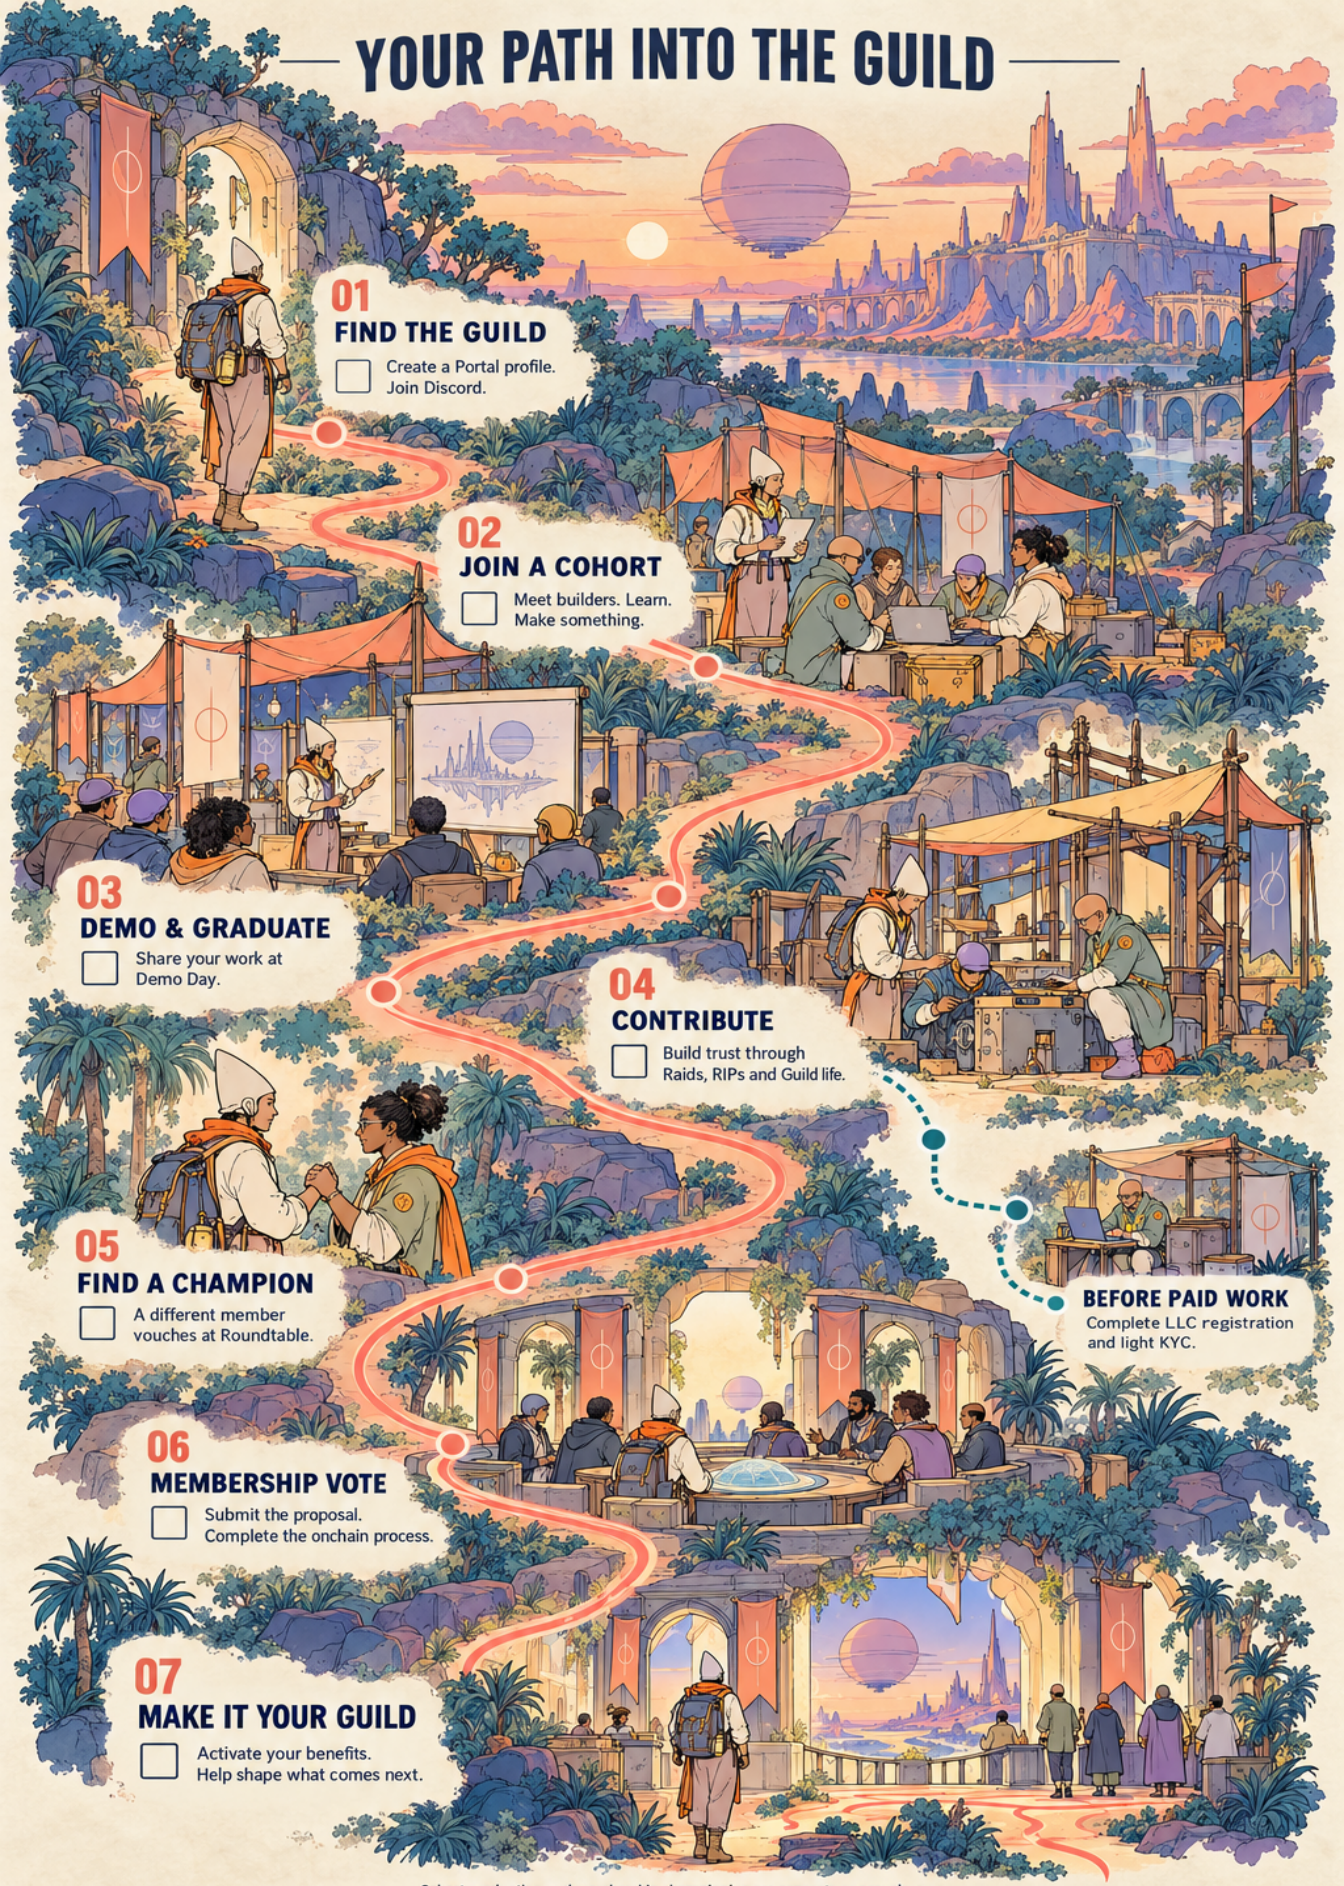
Speak up early when something goes sideways. Describe what happened, listen to its impact, own your part, and agree on a concrete repair. Ask a trusted steward for support when you cannot resolve it together.

Before you set out

What can your party expect from you? What do you need from them? Have that conversation before the first encounter.

If that sounds exhausting, fair enough. If it sounds like your people, pull up a chair.

YOUR PATH INTO THE GUILD



01 FIND THE GUILD

- [ ] Create a Portal profile.
  Join Discord.

02 JOIN A COHORT

- [ ] Meet builders. Learn.
  Make something.

03 DEMO & GRADUATE

- [ ] Share your work at
  Demo Day.

04 CONTRIBUTE

- [ ] Build trust through
  Raids, RIPs and Guild life.

05 FIND A CHAMPION

- [ ] A different member
  vouches at Roundtable.

06 MEMBERSHIP VOTE

- [ ] Submit the proposal.
  Complete the onchain process.

07 MAKE IT YOUR GUILD

- [ ] Activate your benefits.
  Help shape what comes next.

BEFORE PAID WORK

Complete LLC registration and light KYC.

Cohort graduation and membership championing are separate approvals.

Seven stops, separate approvals

Cohort graduation and full membership Championing are distinct decisions.

01 Find the Guild

Create a Portal profile and join Discord. Start with either door.

02 Join a cohort

Signal interest in Portal and complete the cohort's learning and workshops.

03 Demo and graduate

An accepted Demo Day submission leads to cohort graduate or apprentice status.

04 Contribute

Build trust through Raids, RIPs, meetings, and Guild life.

05 Find a Champion

A current member other than your cohort host speaks for you at Raider Roundtable.

06 Membership proposal

Submit and complete the onchain proposal under current governance settings.

07 Make it your Guild

Participate in governance and activate resources through their current processes.

Before paid work

LLC registration and light KYC are required before receiving paid Raid compensation. This is separate from DAO membership.

Meet the party · I

Twelve illustrated archetypes suggest ways people may contribute; they are not fixed ranks or assignments.

Cleric

Account Manager

You might be the person who cares for a client relationship and keeps expectations clear.

Monk

Support

You might be the person who supports a party with coordination and follow-through.

Warrior

Builder

You might be the person who builds and ships a piece of the work.

Archer

Design

You might be the person who makes a product clearer and easier to use through design.

Paladin

Backend Dev

You might be the person who builds the services and systems behind an experience.

Necromancer

DevOps

You might be the person who keeps delivery systems and infrastructure working.

Meet the party · II

Twelve illustrated archetypes suggest ways people may contribute; they are not fixed ranks or assignments.

Bard

Marketing

You might be the person who helps tell the story of useful work.

Wizard

Smart Contracts

You might be the person who designs and builds smart-contract systems.

Hunter

BizDev

You might be the person who discovers a fitting opportunity and starts a useful conversation.

Ranger

UX/User Testing

You might be the person who learns from users and tests how an experience works.

Druid

Data Science/Analytics

You might be the person who finds patterns in data and helps others understand them.

Mystic Alchemist

DAO Consultant

You might be the person who helps a DAO work through design and coordination questions.

Cleric & Monk

Class field notes · two ways to help a party

STR Shipping · DEX Adaptation · CON Follow-through · INT Systems · WIS Judgment · CHA Connection. Suggested archetype stats. Redistribute freely. Choose, combine, and change paths freely. They name useful directions, not levels or gates.

ACCOUNT MANAGER · CLIENT STEWARD

Cleric

The Cleric makes a client relationship feel cared for without promising what the party cannot deliver. They listen for the real need, translate a broad wish into decisions a team can act on, and keep expectations visible when scope or timing changes. An Account Manager knows that trust grows through clear follow-through, including an honest account of what remains unknown.

In a Raid, the Cleric is often the bridge between a client and the builders. They organize useful conversations, record decisions, check who owns each next step, and help the party notice when a quiet concern needs attention.

When the quest changes, the Cleric does not hide the turn. They bring the new information to the client and party, check the agreement, and help everyone choose a responsible next step.

Proficiencies. Client discovery · Scope alignment · Expectation setting · Stakeholder updates

OPTIONAL PATHS

Carekeeping. Keep promises visible, notice when a teammate needs help, and make difficult conversations easier to begin. · **Client Stewardship.** Translate a client's needs into clear agreements, calm updates, and a dependable point of contact. · **Rituals.** Design check-ins and handoffs that help a scattered party stay connected through the work.

SIGNATURE MOVES

Name the quest. Turn a client's scattered needs into a short, agreed brief with outcomes, owners, and open questions.

Keep the campfire lit. Send a candid update that names completed work, risks, decisions needed, and the next meeting.

Useful gear. Ledger of Promises (decision log), a shared scope, conversation notes, and the party calendar.

STR 9	**DEX 11**	**CON 12**
INT 13	**WIS 15**	**CHA 16**

SUPPORT · PARTY SUPPORT

Monk

The Monk notices the work between the visible tasks. Support can mean preparing a room for a good discussion, making sure a new contributor has context, or tracking a loose end before it becomes a blocker. They bring patience and practical attention to a party that may be moving quickly across disciplines.

On a Raid, the Monk helps the party keep its rhythm. They gather decisions where people can find them, follow up on commitments, and ask whether each participant has what they need to contribute. They can help surface a stalled handoff early and bring the right people together to resolve it. Their best work leaves the group more capable, not more dependent on them.

The Monk knows that support is a skill rather than an afterthought. They can spot a missing owner, welcome a newcomer into the context, and help a busy group finish what it began.

Proficiencies. Meeting facilitation · Task follow-through · Onboarding support · Knowledge sharing

OPTIONAL PATHS

Onboarding. Help new builders find the right doorway, people, and next action without losing their curiosity. · **Troubleshooting.** Trace a blocked workflow patiently, gather useful evidence, and bring the right specialist into the room. · **Community Care.** Hold space for questions and feedback while keeping support routes and expectations easy to understand.

SIGNATURE MOVES

Clear the path. Collect missing context, access, and decisions before they slow the next piece of work.

Hold the circle. Make room for quieter voices and end a meeting with named actions and owners.

Useful gear. Compass of Context (shared notes), a project board, access checklist, and short check-ins.

STR 10	**DEX 13**	**CON 15**
INT 12	**WIS 16**	**CHA 12**

Class labels follow the supplied Portal export · Skills and roles · handbook ↗

Bard & Wizard

Class field notes · two ways to help a party

MARKETING · STORY AND REACH

Bard

The Bard helps useful work find the people who need to understand it. Marketing here begins with listening: who is this for, what changed, and what evidence supports the story? The Bard can shape a launch, a community update, or a simple explanation of an unfamiliar product. They give the work a memorable voice while staying faithful to what the party actually built.

On a Raid, the Bard asks the builders for concrete details, the client for its audience, and users for language that sounds like real life. They plan channels and timing, draft copy, and check that claims can be supported. A good campaign is a bridge between a finished artifact and a community able to use it.

A message succeeds when the right people know what the work does, why it matters, and where they can learn more.

Proficiencies. Audience research · Messaging · Editorial planning · Campaign review

OPTIONAL PATHS

Storytelling. Turn actual Guild work into memorable narratives with clear sources, voices, and an invitation to participate. · **Audiovisual.** Blend AI writing, audio, image, motion, and video tools with human editing to make stories travel. · **Campaigns.** Coordinate social posts, releases, and community moments so a useful message reaches the right people.

SIGNATURE MOVES

Find the refrain. Turn a complex project into one clear promise supported by examples and limits.

Call the audience. Prepare a launch note, gather feedback, and revise the next message from what people understood.

Useful gear. Songbook of Evidence (message map), interview notes, accessible images, and an editorial calendar.

STR 9	DEX 12	CON 11
INT 14	WIS 13	CHA 17

SMART CONTRACTS · CONTRACT CRAFT

Wizard

Their magic is careful reasoning about what should happen, what could go wrong, and what happens when the unexpected arrives. Code that manages shared resources deserves clear requirements and review before anyone relies on it. A Wizard is most useful when they can explain the system to the people it affects, not only to other contract developers.

On a Raid, the Wizard turns product intent into testable behavior. They ask about permissions, failure states, upgrades, and what should remain immutable. They coordinate with designers and other builders so the interface tells the truth about the contract underneath. When it is time to hand over, they document assumptions, tests, and operational limits.

Before deployment, the Wizard asks the party to rehearse what happens when an assumption fails. That conversation can change a permission, a test, or a handoff before the cost rises.

Proficiencies. Contract design · Testing · Security review · Technical handoff

OPTIONAL PATHS

Contract Craft. Write and test smart contracts whose permissions, state changes, and failure paths a party can explain. · **Protocol Design.** Shape system rules and interfaces so builders can coordinate without hiding the important tradeoffs. · **Security.** Review assumptions, threat paths, and tests before powerful code crosses the boundary into production.

SIGNATURE MOVES

Trace the spell. Write a test for the intended path and the edge case that could surprise the party.

Open the grimoire. Explain permissions, risks, and contract behavior in language the client can use.

Useful gear. Grimoire of Edge Cases (test suite), specifications, version control, and deployment checklist.

STR 10	DEX 12	CON 13
INT 17	WIS 15	CHA 11

Class labels follow the supplied Portal export · Skills and roles · handbook ↗

Warrior & Archer

Class field notes · two ways to help a party

BUILDER · HANDS-ON BUILDER

Warrior

The Warrior builds and ships a concrete piece of the quest. The name suggests courage, but the useful habit is disciplined craft: choose a tractable slice, make it work, and leave enough context for another person to continue. They face constraints directly and make progress visible rather than hiding uncertainty behind confidence.

On a Raid, the Warrior works with design, product, and technical companions to turn a brief into working software. They clarify acceptance criteria before starting, show an early version, and respond to feedback while there is still room to change course. They keep the branch reviewable and the handoff understandable. When pressure rises, they protect the party by naming tradeoffs instead of silently cutting corners.

A small, clear change with evidence of what it does can be stronger than a heroic rush to finish alone.

Proficiencies. Implementation · Code review · Prototyping · Delivery

OPTIONAL PATHS

Frontend Building. Turn a design into a fast, accessible interface that real people can navigate and use. · **Product Engineering.** Carry a feature across components, data, tests, and release until the outcome works end to end. · **Integration.** Connect tools and services carefully, making failures visible and handoffs clear to the next builder.

SIGNATURE MOVES

Take the first step. Ship a small end-to-end slice so the party can test the real shape of the solution.

Raise the shield. Call out a dependency or risk early, with a practical option for moving forward.

Useful gear. Forge Kit (local development setup), issue notes, version control, tests, and a clear demo.

STR 17	**DEX 13**	**CON 15**
INT 13	**WIS 12**	**CHA 10**

DESIGN · VISUAL DIRECTION

Archer

The Archer brings design into focus. They study what a person is trying to do, decide where attention should land, and give an experience a visual language that supports the task. It calls for understanding the audience, the content, and the constraints of the medium. The Archer can make complexity approachable while keeping the distinctive character of a project alive.

On a Raid, the Archer turns research and product goals into sketches, flows, and detailed designs that builders can implement. They invite feedback early, explain why a choice helps the user, and check the result in the working product. They notice where copy, contrast, spacing, or state changes can alter meaning. Their handoff gives the next person a path rather than a picture with unanswered questions.

The Archer shares work in progress because a sketch can reveal a bad assumption cheaply.

Proficiencies. Visual design · Interaction flows · Prototyping · Accessibility

OPTIONAL PATHS

Product Design. Find the user's real target, prototype a path, and sharpen the interface through observation. · **Visual Identity.** Build a coherent visual language that makes the Guild or a client recognizable across touchpoints. · **Creative Technology.** Mix design, code, and interactive media to make an idea tangible before the party commits.

SIGNATURE MOVES

Set the sightline. Sketch a clear path through one important user task before polishing every surface.

Test the target. Compare a design with a real interaction and adjust where people hesitate.

Useful gear. Sightline Map (wireframes), research notes, design files, component guidance, and accessibility checks.

STR 10	**DEX 17**	**CON 12**
INT 14	**WIS 14**	**CHA 12**

Class labels follow the supplied Portal export · Skills and roles · handbook ↗

Hunter & Ranger

Class field notes · two ways to help a party

BIZDEV · OPPORTUNITY SCOUT

Hunter

The Hunter looks for work where the Guild can be genuinely useful. BizDev is not a race to collect leads; it is a practice of finding a fit between a person's problem and a party able to solve it. The Hunter asks good questions before making an introduction.

On a Raid, the Hunter may start the relationship and help shape its first scope. They identify decision makers, surface budget or timing constraints, and bring the right specialists into discovery. They keep the conversation honest about capability and availability. A strong handoff gives the client a clear path to a proposal and gives the party enough context to decide whether to take the work.

They listen for whether the conversation produced a real next step, and they can gracefully close an opportunity that is not right for this party.

Proficiencies. Discovery · Relationship building · Opportunity qualification · Handoff

OPTIONAL PATHS

Opportunity Mapping. Scan the terrain for aligned clients, collaborators, and problems the Guild can actually help solve. · **Partnerships.** Build durable relationships through clear expectations, mutual benefit, and a useful next conversation. · **Scoping.** Turn a promising lead into a concrete brief with ownership, constraints, and a sensible first step.

SIGNATURE MOVES

Read the tracks. Write down the need, the people involved, and why this party might be a good fit.

Open the gate. Make a warm introduction with a precise next conversation and no invented commitments.

Useful gear. Trail Map (relationship map), discovery notes, fit checklist, and a thoughtful follow-up.

STR 11	**DEX 14**	**CON 12**
INT 12	**WIS 15**	**CHA 17**

UX/USER TESTING · USER PATHFINDER

Ranger

The Ranger learns how an experience works for the people who use it. UX and user testing begin with observation: where does someone hesitate, what language do they use, and what do they expect to happen next? The Ranger can work with a prototype, a live product, or even a paper sketch.

On a Raid, the Ranger defines a useful question, recruits or identifies fitting participants, and gives them a realistic task. They listen more than they lead. Afterward they separate what was observed from what they infer, then share patterns the party can act on. They work with the Archer and Warrior to test whether a revision removes friction.

The Ranger makes findings specific enough to guide a change. They can say which participant struggled, with which task, and what happened, without pretending that one session proves a universal truth.

Proficiencies. User interviews · Usability testing · Synthesis · Research reporting

OPTIONAL PATHS

User Research. Listen to people doing the work, document patterns, and bring evidence back to the party. · **Journey Testing.** Walk the full path a user takes, including confusing branches and the moments where trust breaks. · **Accessibility.** Test practical access across devices, inputs, and abilities, then help the team fix the friction.

SIGNATURE MOVES

Scout the route. Watch someone attempt a task and record the point where expectation and interface diverge.

Mark the trail. Turn observations into a prioritized list of changes and questions for another test.

Useful gear. Field Journal (task scripts), consent notes, findings board, and recordings when appropriate.

STR 10	**DEX 15**	**CON 12**
INT 13	**WIS 17**	**CHA 13**

Class labels follow the supplied Portal export · Skills and roles · handbook ↗

Paladin & Necromancer

Class field notes · two ways to help a party

BACKEND DEV · BACKEND GUARDIAN

Paladin

The Paladin builds the services and systems behind the visible experience. Backend development asks for sturdy interfaces, sensible data models, and careful handling of failure. The armor in the illustration suggests reliability, but reliability comes from choices that can be explained and tested.

On a Raid, the Paladin works with the party to define contracts between components, choose where data lives, and protect sensitive operations. They discuss scale and security in proportion to the real task. They write tests around critical behavior and document the assumptions behind an integration. When they deliver, they make monitoring and recovery part of the handoff so the system can keep serving users.

The Paladin treats maintainers as future users. They leave names, logs, and recovery steps that make sense to someone who did not design the original service or sit in the planning meetings.

Proficiencies. API design · Data modeling · Service reliability · Security

OPTIONAL PATHS

Service Design. Build sturdy backend boundaries so data and responsibilities move safely between the right systems. · **API Craft.** Give other builders clear contracts, meaningful errors, and documentation they can use without divination. · **Reliability.** Watch performance and failure modes, then make recovery part of the design instead of an afterthought.

SIGNATURE MOVES

Guard the passage. Define a clear API boundary with useful errors and permission checks.

Keep the watch. Add a test and a signal that make an important failure visible before it spreads.

Useful gear. Shield Wall (API specifications), schemas, logs, tests, and a maintainer runbook.

STR 16	**DEX 11**	**CON 17**
INT 16	**WIS 14**	**CHA 10**

DEVOPS · SYSTEMS RESTORER

Necromancer

The Necromancer keeps delivery systems alive and can bring a faltering service back into working order. DevOps touches deployments, infrastructure, observability, and the small rituals that make changes safer. The title is theatrical; the work is practical. They look for repeatable ways to move software from a developer's machine into an environment people can trust, and they prepare for the day a process breaks.

They ask who receives an alert, where secrets live, and what evidence shows a service is healthy. They coordinate with builders before changing infrastructure that others rely on. Their goal is to leave the party with a system they can operate, not a set of incantations only one person knows.

The Necromancer prepares for ordinary mistakes as well as dramatic outages. A calm, rehearsed recovery path lets a team make necessary changes without depending on luck or a single keeper.

Proficiencies. Deployment automation · Observability · Incident response · Infrastructure

OPTIONAL PATHS

Infrastructure. Keep environments, deployment paths, and secrets organized so a party can build without surprises. · **Resilience.** Prepare monitoring, backups, and recovery moves that make an outage survivable for the people affected. · **Release Operations.** Automate repeatable releases and leave clear rollback steps when the spirits in production stir.

SIGNATURE MOVES

Raise the service. Practice a repeatable deploy and rollback before a critical release.

Read the omens. Connect logs and health signals to a clear response when a service falters.

Useful gear. Resurrection Scroll (rollback plan), pipelines, dashboards, backups, and a recovery runbook.

STR 14	**DEX 12**	**CON 18**
INT 15	**WIS 16**	**CHA 9**

Class labels follow the supplied Portal export · Skills and roles · handbook ↗

Druid & Mystic Alchemist

Class field notes · two ways to help a party

DATA SCIENCE/ANALYTICS · PATTERN READER

Druid

The Druid finds patterns in data and helps others understand what those patterns can and cannot say. The Druid asks where the data came from, what is missing, and which decision the analysis should support. Their craft connects careful measurement with human questions.

On a Raid, the Druid works with the client and party to define a useful measure, inspect data quality, and choose an analysis that fits the available evidence. They make assumptions explicit and share results in a form others can question. They resist dramatic conclusions from a thin sample. The best answer may be a small experiment or a better question, not a dashboard with every possible number.

The Druid can explain a chart without asking the audience to trust the chart alone. They point to the source, the method, and the alternative explanations worth considering before action.

Proficiencies. Data quality · Analysis · Visualization · Experiment design

OPTIONAL PATHS

Analytics. Turn messy activity into honest measures and explanations that help the Guild choose its next move. · **Machine Learning.** Build and evaluate models around useful questions, representative examples, and human judgment at decision points. · **Data Engineering.** Shape reliable pipelines and definitions so others can find, trust, and reuse the same evidence.

SIGNATURE MOVES

Listen to the grove. Audit a dataset for missing context before promising a conclusion.

Map the seasons. Turn a trend into a clear chart, its caveats, and a decision the party can test.

Useful gear. Grove Atlas (data dictionary), queries, notebooks, charts, and an assumptions record.

STR 10	**DEX 11**	**CON 12**
INT 17	**WIS 17**	**CHA 11**

DAO CONSULTANT · DAO GUIDE

Mystic Alchemist

The Mystic Alchemist helps a DAO think through design and coordination questions. A DAO Consultant works where governance, software, incentives, and human practice meet. There is no single recipe that fits every community. Their advice should leave the community able to choose for itself.

On a Raid, the Alchemist may facilitate discovery, compare governance options, and help translate a decision into workable steps. They ask who has authority, how participation happens, and how shared resources are protected. They make tradeoffs legible rather than presenting a tool as an answer to every problem. They can guide a pilot and invite feedback before a process becomes durable.

The Alchemist brings people into the design of the process itself. Those affected by a rule should be able to see its tradeoffs, question its assumptions, and help decide how to improve it.

Proficiencies. Governance design · Facilitation · Incentive analysis · Process review

OPTIONAL PATHS

DAO Design. Help a group choose decision rules, roles, and tools that fit how its people actually cooperate. · **Facilitation.** Guide difficult choices toward clear options, recorded agreements, and room for dissent before commitment. · **Experimentation.** Try small governance changes, observe their effects, and carry the learning into the next cycle.

SIGNATURE MOVES

Mix the ingredients. Lay out two governance choices with benefits, risks, and who does the work.

Test the potion. Run a small, reversible pilot before asking a community to adopt a permanent process.

Useful gear. Alchemist's Bench (decision map), workshop notes, governance drafts, and a review plan.

STR 10	**DEX 12**	**CON 14**
INT 16	**WIS 18**	**CHA 15**

Class labels follow the supplied Portal export · Skills and roles · handbook ↗

Warlock · Forward Deployed Engineer

A featured class · working magic in the client's world

FORWARD DEPLOYED ENGINEER · EMBEDDED CLIENT BUILDER

Warlock

The Warlock steps through a working portal into the client's world. A Forward Deployed Engineer learns the real workflow beside the people who use it, then builds in context. Their magic joins product discovery, engineering, and delivery: a useful system, not a distant demonstration.

On a Raid, the Warlock learns the tools, constraints, and handoffs already in place. They agree on a small testable outcome, connect existing services where possible, and build a thin integration or prototype. They ask who depends on each step, what failure looks like, and which decision belongs to a human. A familiar, a local teammate, challenges assumptions.

Release comes in increments. The Warlock watches real use, tests awkward cases, and widens access as trust grows. They leave documentation, named ownership, and a handoff the client can operate after the party departs.

Proficiencies. Workflow discovery · Rapid prototyping · Systems integration · Incremental release · Client handoff

OPTIONAL PATHS

Discovery. Learn the client's real workflow beside its users, then choose one outcome worth proving first. · **Systems Integration.** Bridge existing tools with a thin connection that preserves context, visibility, and human control. · **Field Delivery.** Release in small steps with the client, watch real use, and leave ownership behind.

SIGNATURE MOVES

Pact Ledger. Agree on one measurable outcome, the people affected, and the acceptance check before casting the first spell.

Bridge Realms. Join two existing tools with a thin, observable integration that can be tested in the real workflow.

Useful gear. Working Portal (client environment), a Pact Ledger (outcome brief), integration tests, logs, release notes, and a familiar who knows the workflow.

STR 12	**DEX** 16	**CON** 14
INT 17	**WIS** 14	**CHA** 15

Field Guide class · Forward Deployed Engineer

Artificer · Automation & Agent Systems

A featured class · dependable magic for recurring work

AUTOMATION & AGENT SYSTEMS · WORKFLOW AND TOOL BUILDER

Artificer

The Artificer hears a mechanism inside a repeated task. They study where information enters, who checks it, and what should happen next. Their craft turns rituals into dependable workflows, useful tools, and bounded agents. The best enchantment is quiet: the right output arrives with enough context to trust it.

On a Raid, the Artificer works beside the process owner. They name the trigger, expected output, and decisions that still need human judgment. Then they build the small automation or agent-assisted step using systems. An agent may gather, sort, or draft; permissions, prompts, and data access remain part of the mechanism to inspect.

They test representative cases, awkward edges, and important failures. Logs and checks show what ran and where it stopped; every spell has a manual path home. After watching real use, the Artificer leaves recovery steps, clear instructions, and a named maintenance owner. A dependable tool keeps helping after its maker leaves.

Proficiencies. Workflow mapping · Automation design · Agent evaluation · Observability · Operational handoff

OPTIONAL PATHS

Automations. Turn a recurring task into a dependable workflow with visible triggers, checks, and recovery moves. · **Agents.** Give AI helpers bounded work, examples, evaluation, and human checkpoints before they touch real decisions. · **Toolmaking.** Build small reusable instruments that fit existing systems and can be maintained by the next party.

SIGNATURE MOVES

Clockwork Pact. Agree on the trigger, output, human checkpoint, and recovery path before the first gear turns.

Familiar Audit. Test an agent on known examples and edge cases, then inspect its actions before widening access.

Useful gear. A Workbench of Triggers (workflow map), test examples, permission ledger, run logs, manual fallback, and a repair guide.

STR 10	**DEX 15**	**CON 14**
INT 18	**WIS 16**	**CHA 12**

Field Guide class · Automation & Agent Systems

How a Raid works

The spherical airship is a diagram of collaboration, not a prescribed organization chart.

02

Keep the party connected

Keep decisions, progress, and next actions visible. Coordinate internally and agree on a useful communication channel with the client.

04

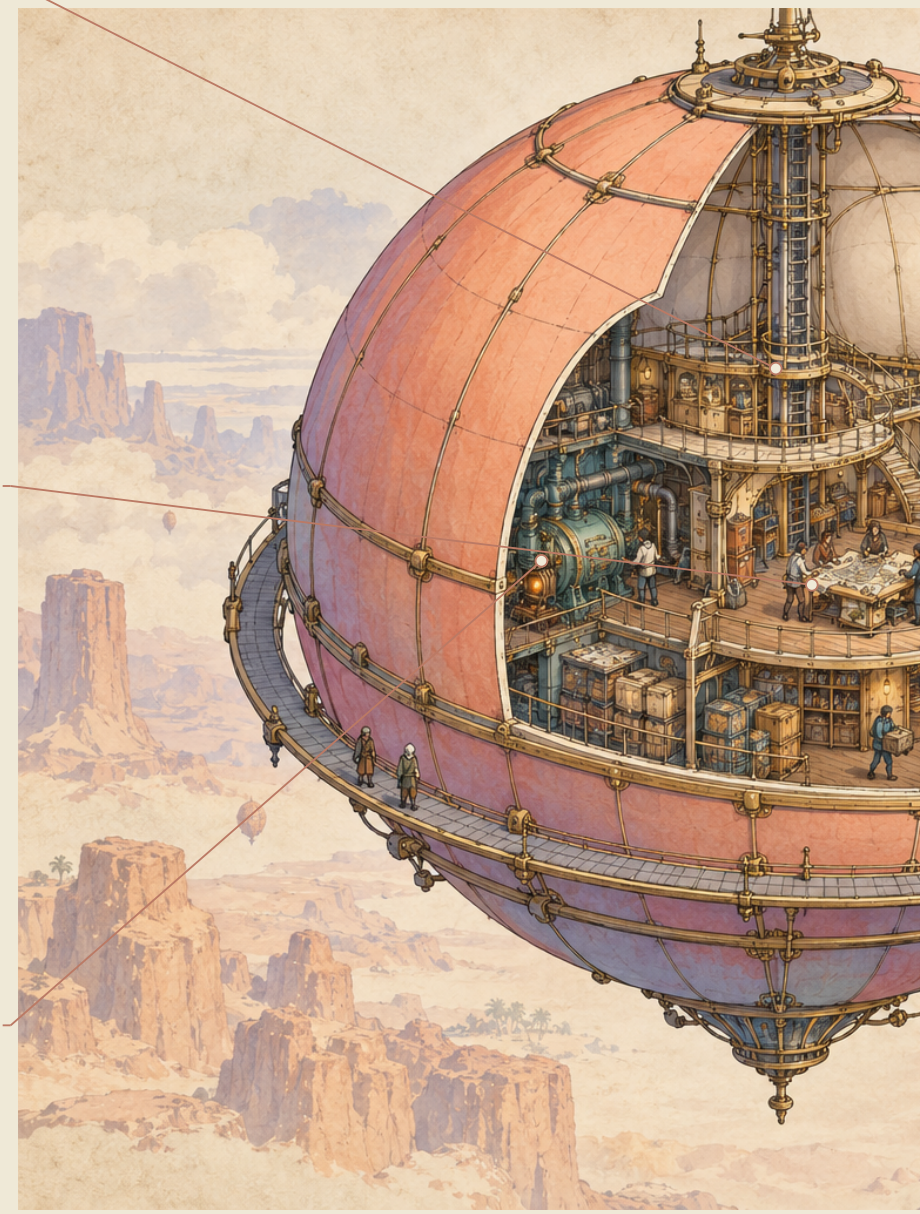
Build with complementary skills

Bring the right skills together and make responsibility for each part clear. The party delivers the agreed work, with an agreed delivery lead when assigned.

07

Keep the expedition running

Contracts, records, and financial administration support the party's work. Coordinate with the responsible operators and use the approved systems.



Spatial functions describe the work around a Raid; their numbering is not a required sequence. Each deck responsible operators and use approved systems for contracts, records, and payments.

k suggests a function that helps a client engagement stay clear and accountable. Coordinate with the

01

Agree on the destination

Clarify the client's need, intended outcomes, deliverables, responsibilities, timeline, and budget. Give the party a shared destination.

03

Make the engagement clear

Agree scope, milestones, responsibilities, commercial terms, payment schedule, and the party split before the engagement is authorized to start.

05

Review the work together

Share work, gather feedback, and check it against the agreed outcomes. Keep the client relationship and delivery expectations aligned as the work develops.

06

Deliver and close the loop

Confirm acceptance, hand over the work, resolve final payment and distributions, and leave useful documentation. Capture lessons for the next party.

An idea becor

3 Shape the proposal

Set scope, ownership, budget, risks, and success criteria.

2 Find collaborator

Discuss in the current Guild sp
alternatives.

1 Describe the problem

Explain who benefits and the intended outcome.

6 Deliver and repo

Agree release conditions, do
results, and close out.

A proposal starts with a problem worth solving and becomes stronger as more people can understand and shape it. Each turn leaves a clearer record for collaborato
RIP can become a funded shared project when governance approves it. Follow the visible trail from shared question to accountable work. Check the current RIP guid

4 Record the final RIP

Keep a durable proposal in the Guild RIPs GitHub repository with discussion links.

rs and members. Bring a problem or experiment into the open. Find collaborators, test the scope, and write a proposal clear enough for the Guild to deliberate. A de before submitting a proposal. Check the handbook for current submission and governance details before acting.

The Guild Kit walker

A desert walker makes shared support visible through a playful exploded diagram.

03

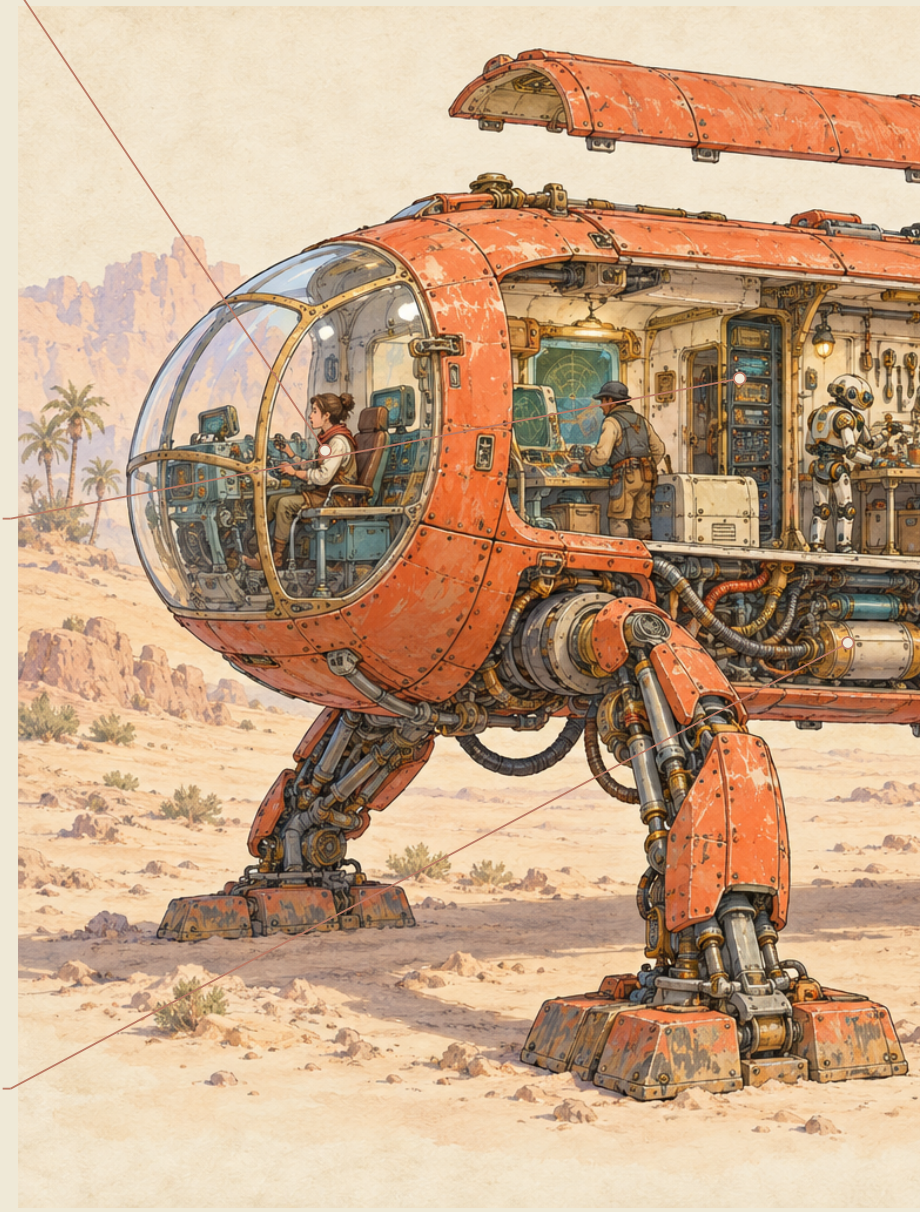
Ownership and governance

Members can vote and propose uses of collective resources under current governance processes.

04

Guild email and web presence

Ask the Infrastructure Maestro to coordinate Guild email, website hosting, and a domain or subdomain setup.

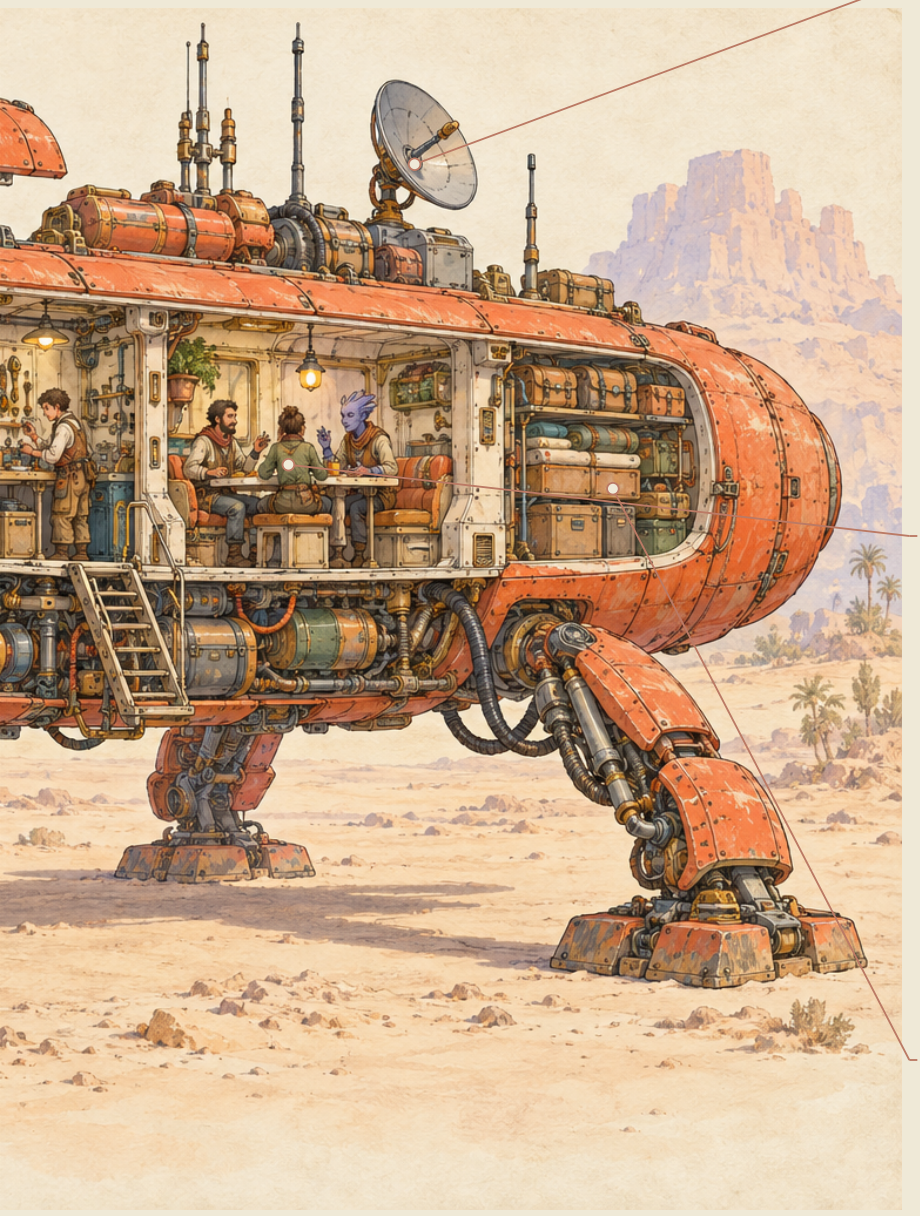


02

Shared business operations

Coordinate contracts, client payments, records, and financial administration through responsible Guild operators.

Membership brings people, a shared business foundation, governance, and tools that support work. Its p
resource has its current steward, access route, and approval requirements. Membership does not guaran



arts are metaphors for tools and coordination; they do not grant access or authority by themselves. Each
tee paid work or an automatic allowance.

05

Prism and Queen Raida

Personalized assistance can surface relevant updates and draft context; people bring the judgment and make decisions.

01

People and collaboration

Meet complementary builders, exchange feedback, and develop work through participation.

06

Discretionary support and RIPs

The Cookie Jar follows its active allowlist, limits, purpose, and evidence rules. RIPs provide a route to propose shared work for approval.

Open the doors. Choose a move.

Five places to look; five ways to begin.

FIVE PUBLIC DOORS

Portal
Profiles, cohort interest, sessions, and posts.

Discord
Live conversation and community coordination.

Handbook
Current joining, membership, Raid, and operating guidance.

GitHub
Open-source work and the RIP record.

DAOhaus
Onchain proposals and governance records.

FIVE POSSIBLE MOVES

01 Share your skills
Keep your Portal profile current so people can find your interests and work.

02 Join a session
Look for a Guild gathering or cohort opportunity and show up ready to learn.

03 Find a collaborator
Start a conversation with someone whose strengths complement yours.

04 Bring an improvement idea
Name the problem, invite questions, and use the RIP route when the work is ready.

05 Ask about Guild Kit setup
If eligible, contact the Infrastructure Maestro about email, web presence, or personalized assistance.

ATLAS FIELD NOTES

The Gathering Hall, Workshop, Expedition Dock, Archive, and Commons are places to gather, build, raid, learn, and share. Queen Raida helps surface context; people make the judgments. Moloch names coordination failure. The arrival road is yours to walk.

THE ROAD CONTINUES

The next quest is yours

Bring something strange. Find your party. Build something worth sharing.

RaidBrood: a side quest from the Guild

Tavern notice · one offshoot, many kinds of craft

QUEST POSTED / THE BREWING TABLE

RAIDBROOD

QUEST NOTICE · ETHDENVER 2022

BLOOD OF MOLOCH · IMPERIAL STOUT

A can, a club, and a side quest brewed from Guild collaboration.

See the original Blood of Moloch label ↗

A party takes a different road

Some Guild quests begin with a client brief. This one began with a shared taste for making things together. Sasquatch (Ian Boucher) started RaidBrood as an offshoot of RaidGuild: a beer club DAO where a community could gather around a brew and help shape what came next.

RaidBrood carried the Guild's habit of bringing different crafts to one table. Brewers, designers, developers, and writers could each contribute to the same experiment. The work was a bottle, a story, a gathering, and a set of tools for choosing future releases.

Blood of Moloch

Its Blood of Moloch imperial stout appeared at ETHDenver in 2022. The name puts a familiar Guild foe on the label: Moloch, the pull toward outcomes nobody chose together. Here the counterspell is delightfully practical—make something people want to share, then invite them to decide what to brew next.

A RaidBrood share gave members a say in future brews. It turned a playful side project into a small exercise in collective ownership.

PARTY COMPOSITION

Brewer · makes the drink

Developer · builds the club tools

Designer · gives the vessel and label a face

Writer · carries the tale

Side quests show what a Guild can make when a member brings another passion into the party.

RaidBrood · Guild side quest ↗ · Sasquatch · Ian Boucher ↗

Different quests. The same builder instinct.

Supplementary field notes · RaidGuild AI & RaidGuild Forge

A Guild is a place to assemble a party, not a limit on where that party can travel. Alongside client Raids, members keep finding new settings for the same impulse: learn something difficult, make it useful, and invite others to build on it.

TAKE THE MAGIC TO WORK

RaidGuild AI

Practical AI help for owner-led businesses and small teams.

RaidGuild AI starts with familiar work: research, email, follow-up, scheduling, reports, and the repeated computer tasks that consume a week. Builders help owners and teams spot useful opportunities, practice on real tasks, and turn the patterns that work into workflows they can own.

The path is deliberately hands-on. A readiness conversation identifies a starting point; a working session introduces tools and prompts; weekly practice helps the team learn what deserves trust and where human judgment still matters. A handoff guide keeps the learning in the business.

1. Find a repeated task.
2. Try a small workflow with its users.
3. Review what happened, improve, and hand it over.

Explore RaidGuild AI ↗

BUILD WORLDS THAT PUSH BACK

RaidGuild Forge

A meeting place for games, makerspaces, and useful machines.

Forge brings engineering into play. People design components, assemble machines, and test them through games, challenges, and physical constraints. A creation earns its story through what it can actually do: handle a corner, hold together, solve a problem, or survive an encounter.

Its experiments include Titan Racers, a sci-fi RC racing game in development, and DAO: The Game, a playable management demo about an impromptu studio of autonomous agents. Forge is also building toward a marketplace for components, machines, and physical kits tested through play.

1. Engineers design parts under real constraints.
2. Assemblers combine parts into machines.
3. Players test the results and reveal what works.

Explore RaidGuild Forge ↗

The common thread

These projects take different routes: one enters everyday business, another builds worlds for experimentation. Both make room for a useful first prototype, people with complementary skills, and knowledge that survives the original party. Your side quest can start just as small.

Your side quest

Quest journal · give an unexpected idea a first gathering

What would you make if you brought a nonwork obsession to the Guild table? Start small. A side quest needs a first party and an experiment, not a complete campaign.

01 The spark

A craft, curiosity, problem, place, or object you keep returning to.

02 The party

Whose complementary skills would make the idea more interesting?

03 First experiment

What could the party make, test, or share in one short outing?

04 Next gathering

Where will you invite people, and what will you ask them to bring?

A good side quest leaves a trail others can pick up.

MMD · Meme Driven Development

Workshop · follow the joke until it becomes a useful experiment

MMD (Meme Driven Development) is a playful name for building something because a meme or running joke creates interest and momentum.

MEME → COMMUNITY EXCITEMENT → PROTOTYPE → FEEDBACK → USEFUL PRODUCT—OR A BETTER MEME

At the tavern. A community jokes about needing a "proof of touching grass" app, and someone builds it.

At the workbench. It is an informal approach, not a standardized methodology. Memes can spark ideas and attract early users; the real test is whether people keep using what you build.

01 / FIELD QUESTION

The meme

What joke, image, phrase, or shared frustration keeps resurfacing?

02 / FIELD QUESTION

The people

Who is laughing, joining in, or asking for it to exist?

03 / FIELD QUESTION

The smallest build

What could the party make in one short sprint?

04 / FIELD QUESTION

The signal

What would people do after the joke wears off?

If it works, make it useful. If it doesn't, improve the meme.

Request to join the Guild

Character record · bring your work and your champion

Bring your cohort, work, and champion into one record.
